

Tell me about yourself: I am a 4th year student studying Information Technology at technological institute of the Philippines, I am currently seeking an internship opportunity in web development field to gain hands-on experience and developing my skills. I am excited about the opportunity to apply my skills and continue learning in a professional setting through your company.

Rate yourself 1-10: I think as an intern, I would rate myself 6. Because I have only been studying and working with this field for a about 4 years, but I am still learning and improving my skills. I have completed some simple projects and exercises, but I still have a lot to learn before I can consider myself proficient.

Comparison of IT and CS: Generally, I think computer science refers to designing and building computers and computer programs. Information technology, on the other hand, refers to maintaining and troubleshooting those computers and their networks, systems, and databases to ensure they run smoothly.

As an IT how can you help improve TIP: I think as an IT student I can work with teachers and administrators to develop and deploy educational technology that enhances the learning experience, such as interactive whiteboards, online learning platforms, and virtual reality systems.
